

Title

Comparative effectiveness of home blood pressure monitoring for hypertension: a pragmatic service evaluation

Abstract

A multicentre investigation examined home blood pressure monitoring against standard care in 117 adults with hypertension. The intervention showed a small but measurable benefit for glycaemic control, while treatment exposure and adverse events were broadly comparable between groups. The findings should be considered alongside short follow-up and incomplete adherence data. Recruitment pathways and treatment fidelity were examined to support interpretation of the estimates. This report is from a parallel-group randomized controlled trial comparing Control: placebo education vs Intervention: CBT + strength and balance exercise.
