

Title

Longer-term outcomes following home blood pressure monitoring in hypertension: a longitudinal cohort analysis

Abstract

This follow-up examined participants with hypertension after the initial evaluation of home blood pressure monitoring. At six to twelve months, the direction of change in glycaemic control was assessed alongside treatment persistence, healthcare use, and late adverse events. The analysis suggests durable benefit for some participants but remains vulnerable to loss to follow-up. Patient retention varied by site, with the largest losses occurring before the final assessment. This report is from a parallel-group randomized controlled trial comparing Control: placebo education vs Intervention: CBT + strength and balance exercise.
