

Title

Baseline characteristics of adults enrolled in an evaluation of home pulmonary rehabilitation: a participant-level secondary analysis

Abstract

This baseline report describes 154 adults enrolled to assess home pulmonary rehabilitation for chronic obstructive pulmonary disease. Participants were recruited using electronic records and clinician referral; baseline severity, medication use, functional status, and social factors were recorded before treatment allocation. The cohort was broadly representative of the intended clinical population, although referral patterns may affect external validity. Results were interpreted alongside baseline severity, treatment exposure, and concurrent care. This report is from a parallel-group randomized controlled trial comparing Control: wait-list care vs Intervention: strength and balance exercise + inhaled anti-inflammatory therapy.
