

Title

A pragmatic evaluation of home pulmonary rehabilitation for chronic obstructive pulmonary disease: a community-based assessment

Abstract

Investigators explored home pulmonary rehabilitation against standard care in 154 adults with chronic obstructive pulmonary disease. The observed difference was clinically interpretable for exercise tolerance, while treatment exposure and adverse events were broadly comparable between groups. Generalisability may be reduced because participating sites had established research infrastructure. The investigators reported uncertainty intervals rather than relying on a single summary estimate. This report is from a parallel-group randomized controlled trial comparing Control: wait-list care vs Intervention: strength and balance exercise + inhaled anti-inflammatory therapy.
