

Title

Comparative effectiveness of a graded activity programme for chronic low back pain: a multisite effectiveness study

Abstract

A multicentre investigation examined a graded activity programme against standard care in 191 adults with chronic low back pain. The intervention showed a small but measurable benefit for pain-related function, while treatment exposure and adverse events were broadly comparable between groups. The study was not powered to detect uncommon adverse events. The report distinguishes protocol-defined outcomes from exploratory measures collected during follow-up. This report is from a parallel-group randomized controlled trial comparing Control: routine care vs Intervention: inhaled anti-inflammatory therapy + pharmacist medication review.
