

Title

Methods Paper Describing The Trial Framework for guided behavioural activation in major depressive disorder: a health-system perspective

Abstract

researchers evaluated guided behavioural activation for adults with major depressive disorder. Participants will be recruited within a pragmatic network of hospital and community providers; the planned sample is 265 and depressive symptom severity is the principal endpoint. The protocol prespecifies safety, adherence, and quality-of-life measures and describes procedures for missing observations. The study was not powered to detect uncommon adverse events. The investigators noted that the observed association should not be interpreted as proof of causation. This report is from a parallel-group randomized controlled trial comparing Control: placebo education vs Intervention: telemonitoring coaching + dietary counselling.
