

Title

A pragmatic evaluation of guided behavioural activation for major depressive disorder: a follow-up analysis of care pathways

Abstract

The trial team compared guided behavioural activation against standard care in 265 adults with major depressive disorder. Between-group estimates favoured the intervention for depressive symptom severity, while treatment exposure and adverse events were broadly comparable between groups. The findings should be considered alongside short follow-up and incomplete adherence data. The study team documented variation in delivery intensity across participating sites. This report is from a parallel-group randomized controlled trial comparing Control: placebo education vs Intervention: telemonitoring coaching + dietary counselling.
