

Title

Protocol And Statistical Analysis Plan for home strength and balance exercise in postoperative joint replacement recovery: an analysis of treatment persistence

Abstract

a multicentre investigation examined home strength and balance exercise for adults with postoperative joint replacement recovery. Participants will be recruited across community services and outpatient practices; the planned sample is 302 and functional mobility is the principal endpoint. The protocol prespecifies safety, adherence, and quality-of-life measures and describes procedures for missing observations. The findings should be considered alongside short follow-up and incomplete adherence data. The findings are intended to inform evidence synthesis rather than replace confirmatory trials. This report is from a parallel-group randomized controlled trial comparing Control: wait-list care vs Intervention: dietary counselling + mindfulness sessions.
