

Title

Who benefits from home strength and balance exercise? A subgroup analysis in postoperative joint replacement recovery: a service-user experience report

Abstract

This analysis explored heterogeneity of response to home strength and balance exercise in adults with postoperative joint replacement recovery. Improvement in functional mobility was observed across several prespecified strata, with the largest estimates among participants with greater baseline impairment. The findings are exploratory and require confirmation in independent cohorts. Patient retention varied by site, with the largest losses occurring before the final assessment. This report is from a parallel-group randomized controlled trial comparing Control: wait-list care vs Intervention: dietary counselling + mindfulness sessions.
