

Title

Budget impact of home strength and balance exercise for postoperative joint replacement recovery: a comparison across recruitment settings

Abstract

A within-trial economic evaluation estimated healthcare use and costs associated with home strength and balance exercise for postoperative joint replacement recovery. Resource use, service contacts, medication changes, and quality-adjusted survival were compared with standard care. Results were sensitive to assumptions about intervention delivery and longer-term maintenance. Results depended most strongly on the assumed rate of continued service use after the study period. This report is from a parallel-group randomized controlled trial comparing Control: wait-list care vs Intervention: dietary counselling + mindfulness sessions.
