

Title

Baseline characteristics of adults enrolled in an evaluation of personalised dietary counselling: a pragmatic registry analysis

Abstract

This baseline report describes 339 adults enrolled to assess personalised dietary counselling for hypertension. Participants were recruited using electronic records and clinician referral; baseline severity, medication use, functional status, and social factors were recorded before treatment allocation. The cohort was broadly representative of the intended clinical population, although referral patterns may affect external validity. The report distinguishes protocol-defined outcomes from exploratory measures collected during follow-up. This report is from a parallel-group randomized controlled trial comparing Control: routine care vs Intervention: mindfulness sessions + educational material.
