

Title

Prospective Study Protocol for pacing and energy conservation coaching in post-viral fatigue syndrome: a longitudinal cohort analysis

Abstract

researchers evaluated pacing and energy conservation coaching for adults with post-viral fatigue syndrome. Participants will be recruited at urban and regional clinical sites; the planned sample is 413 and physical function is the principal endpoint. The protocol prespecifies safety, adherence, and quality-of-life measures and describes procedures for missing observations. The study was not powered to detect uncommon adverse events. Recruitment pathways and treatment fidelity were examined to support interpretation of the estimates. This report is from a parallel-group randomized controlled trial comparing Control: placebo education vs Intervention: CBT + strength and balance exercise.
