

Title

Secondary analysis of physical function after pacing and energy conservation coaching for post-viral fatigue syndrome: a community-based assessment

Abstract

A prespecified secondary analysis examined variation in physical function after pacing and energy conservation coaching among adults with post-viral fatigue syndrome. Effects were explored by baseline severity, age, adherence, and recruitment setting. The pattern was directionally consistent with the primary analysis, but subgroup estimates were imprecise. Patient retention varied by site, with the largest losses occurring before the final assessment. This report is from a parallel-group randomized controlled trial comparing Control: placebo education vs Intervention: CBT + strength and balance exercise.
