

Title

Design And Implementation Protocol for home blood pressure monitoring in hypertension: a patient-centred outcomes report

Abstract

investigators explored home blood pressure monitoring for adults with hypertension. Participants will be recruited using electronic records and clinician referral; the planned sample is 450 and glycaemic control is the principal endpoint. The protocol prespecifies safety, adherence, and quality-of-life measures and describes procedures for missing observations. The study was not powered to detect uncommon adverse events. Results were interpreted alongside baseline severity, treatment exposure, and concurrent care. This report is from a parallel-group randomized controlled trial comparing Control: wait-list care vs Intervention: strength and balance exercise + inhaled anti-inflammatory therapy.
