

Title

A pragmatic evaluation of home blood pressure monitoring for hypertension: results from linked clinical records

Abstract

An outpatient research network tested home blood pressure monitoring against standard care in 450 adults with hypertension. Results were consistent with the prespecified hypothesis for glycaemic control, while treatment exposure and adverse events were broadly comparable between groups. Generalisability may be reduced because participating sites had established research infrastructure. The investigators reported uncertainty intervals rather than relying on a single summary estimate. This report is from a parallel-group randomized controlled trial comparing Control: wait-list care vs Intervention: strength and balance exercise + inhaled anti-inflammatory therapy.
