

Title

Methods Paper Describing The Trial Framework for home pulmonary rehabilitation in chronic obstructive pulmonary disease: a mixed-methods implementation report

Abstract

an outpatient research network tested home pulmonary rehabilitation for adults with chronic obstructive pulmonary disease. Participants will be recruited through primary-care and specialist clinics; the planned sample is 487 and exercise tolerance is the principal endpoint. The protocol prespecifies safety, adherence, and quality-of-life measures and describes procedures for missing observations. The findings should be considered alongside short follow-up and incomplete adherence data. Service capacity and local referral practices influenced the observed pattern of care. This report is from a parallel-group randomized controlled trial comparing Control: routine care vs Intervention: inhaled anti-inflammatory therapy + pharmacist medication review.
