

Title

Baseline characteristics of adults enrolled in an evaluation of home strength and balance exercise: a report from regional services

Abstract

This baseline report describes 215 adults enrolled to assess home strength and balance exercise for postoperative joint replacement recovery. Participants were recruited across community services and outpatient practices; baseline severity, medication use, functional status, and social factors were recorded before treatment allocation. The cohort was broadly representative of the intended clinical population, although referral patterns may affect external validity. The report discusses how missing observations may affect interpretation of the final estimates. This report is from a parallel-group randomized controlled trial comparing Control: routine care vs Intervention: mindfulness sessions + educational material.
