

Title

Patient-reported experience after home strength and balance exercise for postoperative joint replacement recovery: a comparison across recruitment settings

Abstract

This report examined patient-reported experience and quality of life after home strength and balance exercise for postoperative joint replacement recovery. Participants described changes in daily activity, confidence, symptom control, and care burden. Improvements in functional mobility were accompanied by variable satisfaction with access and treatment workload. Results were interpreted alongside baseline severity, treatment exposure, and concurrent care. This report is from a parallel-group randomized controlled trial comparing Control: routine care vs Intervention: mindfulness sessions + educational material.
