

Title

Registered Protocol For The Planned Evaluation for personalised dietary counselling in hypertension: a study of care access and outcomes

Abstract

investigators explored personalised dietary counselling for adults with hypertension. Participants will be recruited through primary-care and specialist clinics; the planned sample is 252 and systolic blood pressure is the principal endpoint. The protocol prespecifies safety, adherence, and quality-of-life measures and describes procedures for missing observations. Generalisability may be reduced because participating sites had established research infrastructure. A prespecified sensitivity analysis produced estimates in the same general direction. This report is from a parallel-group randomized controlled trial comparing Control: usual care vs Intervention: CBT + educational material.
