

Title

A pragmatic evaluation of personalised dietary counselling for hypertension: an analysis of longer-term use

Abstract

The trial team compared personalised dietary counselling against standard care in 252 adults with hypertension. Results were consistent with the prespecified hypothesis for systolic blood pressure, while treatment exposure and adverse events were broadly comparable between groups. The findings should be considered alongside short follow-up and incomplete adherence data. The report distinguishes protocol-defined outcomes from exploratory measures collected during follow-up. This report is from a parallel-group randomized controlled trial comparing Control: usual care vs Intervention: CBT + educational material.
