

Title

Methods Paper Describing The Trial Framework for brief sleep restriction therapy in insomnia in older adults: a report on clinical decision-making

Abstract

investigators explored brief sleep restriction therapy for adults with insomnia in older adults. Participants will be recruited using electronic records and clinician referral; the planned sample is 289 and sleep efficiency is the principal endpoint. The protocol prespecifies safety, adherence, and quality-of-life measures and describes procedures for missing observations. The study was not powered to detect uncommon adverse events. Differences in adherence were more pronounced among participants recruited through community services. This report is from a parallel-group randomized controlled trial comparing Control: placebo education vs Intervention: CBT + strength and balance exercise.
