

Title

Patient-reported experience after brief sleep restriction therapy for insomnia in older adults: evidence from participating centres

Abstract

This report examined patient-reported experience and quality of life after brief sleep restriction therapy for insomnia in older adults. Participants described changes in daily activity, confidence, symptom control, and care burden. Improvements in sleep efficiency were accompanied by variable satisfaction with access and treatment workload. The study team documented variation in delivery intensity across participating sites. This report is from a parallel-group randomized controlled trial comparing Control: placebo education vs Intervention: CBT + strength and balance exercise.
