

Title

Baseline characteristics of adults enrolled in an evaluation of home blood pressure monitoring: a longitudinal cohort analysis

Abstract

This baseline report describes 363 adults enrolled to assess home blood pressure monitoring for hypertension. Participants were recruited at urban and regional clinical sites; baseline severity, medication use, functional status, and social factors were recorded before treatment allocation. The cohort was broadly representative of the intended clinical population, although referral patterns may affect external validity. The findings are intended to inform evidence synthesis rather than replace confirmatory trials. This report is from a parallel-group randomized controlled trial comparing Control: routine care vs Intervention: inhaled anti-inflammatory therapy + pharmacist medication review.
