

Title

Baseline characteristics of adults enrolled in an evaluation of home pulmonary rehabilitation: a community-based assessment

Abstract

This baseline report describes 400 adults enrolled to assess home pulmonary rehabilitation for chronic obstructive pulmonary disease. Participants were recruited across community services and outpatient practices; baseline severity, medication use, functional status, and social factors were recorded before treatment allocation. The cohort was broadly representative of the intended clinical population, although referral patterns may affect external validity. Recruitment pathways and treatment fidelity were examined to support interpretation of the estimates. This report is from a parallel-group randomized controlled trial comparing Control: usual care vs Intervention: pharmacist medication review + telemonitoring coaching.
