

Title

A pragmatic evaluation of home pulmonary rehabilitation for chronic obstructive pulmonary disease: a patient-centred outcomes report

Abstract

The trial team compared home pulmonary rehabilitation against standard care in 400 adults with chronic obstructive pulmonary disease. The observed difference was clinically interpretable for exercise tolerance, while treatment exposure and adverse events were broadly comparable between groups. The study was not powered to detect uncommon adverse events. The report includes a sensitivity analysis using an alternative definition of the primary outcome. This report is from a parallel-group randomized controlled trial comparing Control: usual care vs Intervention: pharmacist medication review + telemonitoring coaching.
