

Title

Registered Protocol For The Planned Evaluation for a graded activity programme in chronic low back pain: results from linked clinical records

Abstract

investigators explored a graded activity programme for adults with chronic low back pain. Participants will be recruited across community services and outpatient practices; the planned sample is 437 and pain-related function is the principal endpoint. The protocol prespecifies safety, adherence, and quality-of-life measures and describes procedures for missing observations. Interpretation is limited by attrition and the pragmatic delivery setting. Patient retention varied by site, with the largest losses occurring before the final assessment. This report is from a parallel-group randomized controlled trial comparing Control: placebo education vs Intervention: telemonitoring coaching + dietary counselling.
