

Title

Comparative effectiveness of structured medication review for heart failure with preserved ejection fraction: a prespecified analysis of outcomes

Abstract

The trial team compared structured medication review against standard care in 474 adults with heart failure with preserved ejection fraction. The primary analysis indicated a modest improvement for symptom burden, while treatment exposure and adverse events were broadly comparable between groups. Interpretation is limited by attrition and the pragmatic delivery setting. Service capacity and local referral practices influenced the observed pattern of care. This report is from a parallel-group randomized controlled trial comparing Control: wait-list care vs Intervention: dietary counselling + mindfulness sessions.
