

Title

Registered Protocol For The Planned Evaluation for brief sleep restriction therapy in insomnia in older adults: an analysis of treatment persistence

Abstract

this prospective study assessed brief sleep restriction therapy for adults with insomnia in older adults. Participants will be recruited through primary-care and specialist clinics; the planned sample is 202 and sleep efficiency is the principal endpoint. The protocol prespecifies safety, adherence, and quality-of-life measures and describes procedures for missing observations. The findings should be considered alongside short follow-up and incomplete adherence data. The investigators noted that the observed association should not be interpreted as proof of causation. This report is from a parallel-group randomized controlled trial comparing Control: wait-list care vs Intervention: strength and balance exercise + inhaled anti-inflammatory therapy.
