

Title

Comparative effectiveness of brief sleep restriction therapy for insomnia in older adults: a report from regional services

Abstract

Researchers evaluated brief sleep restriction therapy against standard care in 202 adults with insomnia in older adults. Results were consistent with the prespecified hypothesis for sleep efficiency, while treatment exposure and adverse events were broadly comparable between groups. The findings should be considered alongside short follow-up and incomplete adherence data. The study team documented variation in delivery intensity across participating sites. This report is from a parallel-group randomized controlled trial comparing Control: wait-list care vs Intervention: strength and balance exercise + inhaled anti-inflammatory therapy.
