

Title

Implementing pacing and energy conservation coaching in routine care for post-viral fatigue syndrome: a comparison across recruitment settings

Abstract

This implementation report describes delivery of pacing and energy conservation coaching for people with post-viral fatigue syndrome across routine services. Staff training, referral pathways, fidelity, reach, and participant engagement were monitored alongside physical function. Adoption was feasible, although local staffing and infrastructure shaped delivery. The report includes a sensitivity analysis using an alternative definition of the primary outcome. This report is from a parallel-group randomized controlled trial comparing Control: routine care vs Intervention: inhaled anti-inflammatory therapy + pharmacist medication review.
