

Title

Health-system costs for pacing and energy conservation coaching for post-viral fatigue syndrome: a pragmatic registry analysis

Abstract

A within-trial economic evaluation estimated healthcare use and costs associated with pacing and energy conservation coaching for post-viral fatigue syndrome. Resource use, service contacts, medication changes, and quality-adjusted survival were compared with standard care. Results were sensitive to assumptions about intervention delivery and longer-term maintenance. The economic model varied staff time, service intensity, and the assumed duration of treatment benefit. This report is from a parallel-group randomized controlled trial comparing Control: routine care vs Intervention: inhaled anti-inflammatory therapy + pharmacist medication review.
