

Title

Comparative effectiveness of pacing and energy conservation coaching for post-viral fatigue syndrome: a study of care access and outcomes

Abstract

Investigators explored pacing and energy conservation coaching against standard care in 239 adults with post-viral fatigue syndrome. Results were consistent with the prespecified hypothesis for physical function, while treatment exposure and adverse events were broadly comparable between groups. Interpretation is limited by attrition and the pragmatic delivery setting. Service capacity and local referral practices influenced the observed pattern of care. This report is from a parallel-group randomized controlled trial comparing Control: routine care vs Intervention: inhaled anti-inflammatory therapy + pharmacist medication review.
