

Title

Adverse events and treatment exposure during pacing and energy conservation coaching for post-viral fatigue syndrome: a multisite patient follow-up

Abstract

Safety data from the evaluation of pacing and energy conservation coaching for post-viral fatigue syndrome were reviewed across 239 participants. Most events were mild or unrelated to treatment; serious events were uncommon and balanced between groups. Exposure, discontinuation, and protocol deviations are reported to support interpretation of the clinical outcome findings. The report distinguishes protocol-defined outcomes from exploratory measures collected during follow-up. This report is from a parallel-group randomized controlled trial comparing Control: routine care vs Intervention: inhaled anti-inflammatory therapy + pharmacist medication review.
