

Title

Design And Implementation Protocol for home blood pressure monitoring in hypertension: evidence from participating centres

Abstract

researchers evaluated home blood pressure monitoring for adults with hypertension. Participants will be recruited through primary-care and specialist clinics; the planned sample is 276 and glycaemic control is the principal endpoint. The protocol prespecifies safety, adherence, and quality-of-life measures and describes procedures for missing observations. Generalisability may be reduced because participating sites had established research infrastructure. Differences in adherence were more pronounced among participants recruited through community services. This report is from a parallel-group randomized controlled trial comparing Control: usual care vs Intervention: pharmacist medication review + telemonitoring coaching.
