

Title

Protocol And Statistical Analysis Plan for home pulmonary rehabilitation in chronic obstructive pulmonary disease: a pragmatic service evaluation

Abstract

investigators explored home pulmonary rehabilitation for adults with chronic obstructive pulmonary disease. Participants will be recruited across community services and outpatient practices; the planned sample is 313 and exercise tolerance is the principal endpoint. The protocol prespecifies safety, adherence, and quality-of-life measures and describes procedures for missing observations. Interpretation is limited by attrition and the pragmatic delivery setting. The investigators noted that the observed association should not be interpreted as proof of causation. This report is from a parallel-group randomized controlled trial comparing Control: placebo education vs Intervention: telemonitoring coaching + dietary counselling.
