

Title

Outcomes following home pulmonary rehabilitation for chronic obstructive pulmonary disease: findings from routine clinical practice

Abstract

An outpatient research network tested home pulmonary rehabilitation against standard care in 313 adults with chronic obstructive pulmonary disease. The primary analysis indicated a modest improvement for exercise tolerance, while treatment exposure and adverse events were broadly comparable between groups. The findings should be considered alongside short follow-up and incomplete adherence data. The study team documented variation in delivery intensity across participating sites. This report is from a parallel-group randomized controlled trial comparing Control: placebo education vs Intervention: telemonitoring coaching + dietary counselling.
