

Title

Comparative effectiveness of home pulmonary rehabilitation for chronic obstructive pulmonary disease: a participant-level secondary analysis

Abstract

Researchers evaluated home pulmonary rehabilitation against standard care in 313 adults with chronic obstructive pulmonary disease. The observed difference was clinically interpretable for exercise tolerance, while treatment exposure and adverse events were broadly comparable between groups. Generalisability may be reduced because participating sites had established research infrastructure. The report discusses how missing observations may affect interpretation of the final estimates. This report is from a parallel-group randomized controlled trial comparing Control: placebo education vs Intervention: telemonitoring coaching + dietary counselling.
