

Title

Baseline characteristics of adults enrolled in an evaluation of a graded activity programme: a patient-centred outcomes report

Abstract

This baseline report describes 350 adults enrolled to assess a graded activity programme for chronic low back pain. Participants were recruited across community services and outpatient practices; baseline severity, medication use, functional status, and social factors were recorded before treatment allocation. The cohort was broadly representative of the intended clinical population, although referral patterns may affect external validity. The analysis also considered differences between hospital and community delivery settings. This report is from a parallel-group randomized controlled trial comparing Control: wait-list care vs Intervention: dietary counselling + mindfulness sessions.
