

Title

Protocol And Statistical Analysis Plan for structured medication review in heart failure with preserved ejection fraction: a mixed-methods implementation report

Abstract

an outpatient research network tested structured medication review for adults with heart failure with preserved ejection fraction. Participants will be recruited within a pragmatic network of hospital and community providers; the planned sample is 387 and symptom burden is the principal endpoint. The protocol prespecifies safety, adherence, and quality-of-life measures and describes procedures for missing observations. The findings should be considered alongside short follow-up and incomplete adherence data. The report includes a sensitivity analysis using an alternative definition of the primary outcome. This report is from a parallel-group randomized controlled trial comparing Control: routine care vs Intervention: mindfulness sessions + educational material.
