

Title

A pragmatic evaluation of structured medication review for heart failure with preserved ejection fraction: a multisite effectiveness study

Abstract

The trial team compared structured medication review against standard care in 387 adults with heart failure with preserved ejection fraction. Between-group estimates favoured the intervention for symptom burden, while treatment exposure and adverse events were broadly comparable between groups. The findings should be considered alongside short follow-up and incomplete adherence data. Patient retention varied by site, with the largest losses occurring before the final assessment. This report is from a parallel-group randomized controlled trial comparing Control: routine care vs Intervention: mindfulness sessions + educational material.
