

Title

Prospective Study Protocol for personalised dietary counselling in hypertension: a real-world assessment of delivery

Abstract

investigators explored personalised dietary counselling for adults with hypertension. Participants will be recruited at urban and regional clinical sites; the planned sample is 498 and systolic blood pressure is the principal endpoint. The protocol prespecifies safety, adherence, and quality-of-life measures and describes procedures for missing observations. Interpretation is limited by attrition and the pragmatic delivery setting. A prespecified sensitivity analysis produced estimates in the same general direction. This report is from a parallel-group randomized controlled trial comparing Control: wait-list care vs Intervention: strength and balance exercise + inhaled anti-inflammatory therapy.
