

## Title

A pragmatic evaluation of personalised dietary counselling for hypertension: an analysis of treatment persistence

## Abstract

Investigators explored personalised dietary counselling against standard care in 498 adults with hypertension. The intervention showed a small but measurable benefit for systolic blood pressure, while treatment exposure and adverse events were broadly comparable between groups. The findings should be considered alongside short follow-up and incomplete adherence data. The report distinguishes protocol-defined outcomes from exploratory measures collected during follow-up. This report is from a parallel-group randomized controlled trial comparing Control: wait-list care vs Intervention: strength and balance exercise + inhaled anti-inflammatory therapy.
