

Title

Design And Implementation Protocol for brief sleep restriction therapy in insomnia in older adults: a report from regional services

Abstract

investigators explored brief sleep restriction therapy for adults with insomnia in older adults. Participants will be recruited at urban and regional clinical sites; the planned sample is 115 and sleep efficiency is the principal endpoint. The protocol prespecifies safety, adherence, and quality-of-life measures and describes procedures for missing observations. The findings should be considered alongside short follow-up and incomplete adherence data. Differences in adherence were more pronounced among participants recruited through community services. This report is from a parallel-group randomized controlled trial comparing Control: routine care vs Intervention: inhaled anti-inflammatory therapy + pharmacist medication review.
