

Title

Treatment effects of brief sleep restriction therapy for insomnia in older adults: a clinical epidemiology analysis

Abstract

This prospective study assessed brief sleep restriction therapy against standard care in 115 adults with insomnia in older adults. The intervention showed a small but measurable benefit for sleep efficiency, while treatment exposure and adverse events were broadly comparable between groups. Interpretation is limited by attrition and the pragmatic delivery setting. The investigators noted that the observed association should not be interpreted as proof of causation. This report is from a parallel-group randomized controlled trial comparing Control: routine care vs Intervention: inhaled anti-inflammatory therapy + pharmacist medication review.
