

Title

Efficacy and safety of pacing and energy conservation coaching for post-viral fatigue syndrome: a service-user experience report, report 110

Abstract

Investigators explored pacing and energy conservation coaching against standard care in 152 adults with post-viral fatigue syndrome. The primary analysis indicated a modest improvement for physical function, while treatment exposure and adverse events were broadly comparable between groups. The study was not powered to detect uncommon adverse events. Results were broadly stable after adjustment for age, baseline severity, and prior treatment. This report is from a parallel-group randomized controlled trial comparing Control: usual care vs Intervention: pharmacist medication review + telemonitoring coaching.
