

Title

Outcomes following home blood pressure monitoring for hypertension: a longitudinal safety analysis

Abstract

The trial team compared home blood pressure monitoring against standard care in 189 adults with hypertension. The intervention showed a small but measurable benefit for glycaemic control, while treatment exposure and adverse events were broadly comparable between groups. Generalisability may be reduced because participating sites had established research infrastructure. The report discusses how missing observations may affect interpretation of the final estimates. This report is from a parallel-group randomized controlled trial comparing Control: placebo education vs Intervention: telemonitoring coaching + dietary counselling.
