

Title

Primary results from home pulmonary rehabilitation for chronic obstructive pulmonary disease: a study of implementation fidelity

Abstract

This prospective study assessed home pulmonary rehabilitation against standard care in 226 adults with chronic obstructive pulmonary disease. The observed difference was clinically interpretable for exercise tolerance, while treatment exposure and adverse events were broadly comparable between groups. Interpretation is limited by attrition and the pragmatic delivery setting. The findings are intended to inform evidence synthesis rather than replace confirmatory trials. This report is from a parallel-group randomized controlled trial comparing Control: wait-list care vs Intervention: dietary counselling + mindfulness sessions.
