

Title

Baseline characteristics of adults enrolled in an evaluation of structured medication review: an analysis of resource use

Abstract

This baseline report describes 300 adults enrolled to assess structured medication review for heart failure with preserved ejection fraction. Participants were recruited through primary-care and specialist clinics; baseline severity, medication use, functional status, and social factors were recorded before treatment allocation. The cohort was broadly representative of the intended clinical population, although referral patterns may affect external validity. Recruitment pathways and treatment fidelity were examined to support interpretation of the estimates. This report is from a parallel-group randomized controlled trial comparing Control: usual care vs Intervention: CBT + educational material.
