

Title

Randomized trial of structured medication review for heart failure with preserved ejection fraction: a report on treatment acceptability

Abstract

Researchers evaluated structured medication review against standard care in 300 adults with heart failure with preserved ejection fraction. The primary analysis indicated a modest improvement for symptom burden, while treatment exposure and adverse events were broadly comparable between groups. Interpretation is limited by attrition and the pragmatic delivery setting. The report includes a sensitivity analysis using an alternative definition of the primary outcome. This report is from a parallel-group randomized controlled trial comparing Control: usual care vs Intervention: CBT + educational material.
