

Title

Adverse events and treatment exposure during structured medication review for heart failure with preserved ejection fraction: a study of care access and outcomes

Abstract

Safety data from the evaluation of structured medication review for heart failure with preserved ejection fraction were reviewed across 300 participants. Most events were mild or unrelated to treatment; serious events were uncommon and balanced between groups. Exposure, discontinuation, and protocol deviations are reported to support interpretation of the clinical outcome findings. Results were interpreted alongside baseline severity, treatment exposure, and concurrent care. This report is from a parallel-group randomized controlled trial comparing Control: usual care vs Intervention: CBT + educational material.
